

HUM 2101: Sociology and Disaster Management

Understand family, marriage issues, industrial society and development of urbanization. Various issues of disaster management

Lecture 7

Md. Arif Chowdhury

Lecturer

Dept. of Climate and Disaster Management
Jashore University of Science and Technology

Family

- The family is a critical social institution that functions as part of society.
- The family is also a distinct social group with its own roles, patterns, and behaviors

Social unit of people related through marriage, birth or adoption who reside together in sanctioned relationships, engage in economic cooperation, socially approved sexual relations, and reproduction and child rearing.

Family

- Hunter societies maintained small families because they were always moving and it was hard for them to feed a lot of mouths
- Once agriculture developed, families became larger to help work on farms.
- Industrialization has led to smaller families once again

Types of Family

On the basis of size and structure or according to the number of members family may be classified into two types such as,

- (i) Nuclear family
- (ii) Joint family or extended family

Nuclear Family:

- ✓ A nuclear family is a family which consists of husband, wife and their unmarried children.
- ✓ The size of nuclear family is very small.
- ✓ It is an autonomous unit.

Extended or joint family

- ✓ Extended or joint family is large in size.
- ✓ It consists of a number of nuclear families.
- ✓ It includes members of three to four generations.
- ✓ It is an extension of parent-child relationship.
- ✓ This family is based on close blood ties.
- ✓ The eldest male member is the head of the family.
- ✓ Extended family consists of father, mother, their sons and their wife, unmarried daughters, grandchildren, grandfather, grandmother, uncles, aunts, their children and so on.
- ✓ This type of family is found to exist in rural communities or agrarian economies.

Industrial society and family

- We live in a society whose family system is based on the strong love and close relationship of the spouses, and in which the basis of marriage is romantic love rather than economics.
- Young people want to select a spouse free from family dictates and to have a intimate and sexual relationship with that person.
- This mode of family and marital life is a unique consequence of industrial society.
- In all industrial societies, the nuclear family is the dominant form of family life.
- Once the extended family is no longer economically adaptive, the emphasis on the nuclear family may well be encouraged by the desire of individuals for greater freedom from control by the older generation.

Rise of the modern family

The rise of the modern family involved the rise of two basic characteristics:

Ties of affection

- Young people started to reject paternal interference in the choice of marriage partners
- Marriage itself came increasingly to be seen as an affective rather than an economic unit
- A growing concern for the welfare of their children became manifest.

Desire for private family life

- By the middle of the 19th century the family had become a unit insisting upon its private existence and its separation from the outside world

Nuclear families have a functional fit with industrial society

Nuclear families allow for:

- **Geographical mobility**

- ✓ Families can move to where the work is

- **Social mobility or meritocracy**

- ✓ In extended families, social mobility can lead to inter-generational conflict, but this is less of a concern when families are “privatized” as small independent units.

- **Specialized roles.**

- ✓ In nuclear families, in industrial societies, men and women have separate specialized roles.

Marriage

- Marriage is a socially supported union involving two or more individuals in what is regarded as a stable, enduring arrangement typically based at least in part on a sexual bond of some kind.
- Marriage is considered by sociologists to be a cultural universal; that is, it exists in some form in all societies.
- Marriage serves important social functions, and social norms often determine the role each spouse takes in a marriage.
- Because marriage is a social construct, cultural norms and expectations determine what a marriage is and who can marry.

Types of marriage in sociology

Arranged marriage

- An arranged marriage is a union usually organized by two peoples' families.
- An arranged marriage is beneficial to both parties and their families for economic and practical opportunities.
- It is not focused on or based on romantic love.

Civil partnership instead of marriage

- A civil partnership is a legal relationship that can be registered by a couple.
- It grants roughly the same rights as a marriage, except for the title and child-adoption rights.

Industrial society and development of urbanization

- Industrialization is the process that takes an agricultural economy and transforms it into a manufacturing one.
- Mass production and assembly lines replace manual and specialized laborers.
- The process has historically led to urbanization by creating economic growth and job opportunities that draw people to cities.
- Urbanization typically begins when a factory or multiple factories are established within a region, which creates a high demand for factory labor.
- Other businesses such as building manufacturers, retailers, and service providers then follow the factories to meet the product demands of the workers.
- This creates even more jobs and demands for housing, thus establishing an urban area.

- In the modern era, manufacturing facilities like factories are often replaced by technology-industry hubs.
- These technological hubs draw workers from other areas in the same way factories used to, contributing to urbanization.

“At a Glance”

- Industrialization transforms an agricultural economy into a manufacturing one while urbanization is characterized by the growth of cities.
- Human civilizations went from being hunter-gatherers to cultivators of crops, which led to an increased dependence on water.
 - Industrialization ushered in a shift from farming to agribusiness.
 - People began moving into urban centers as mechanization and production increased.
- Urbanization continues as areas go through cycles of economic and social reform.

Disaster

- A disaster can be defined as ‘a serious disruption in the functioning of the community or a society causing wide spread material, economic, social or environmental losses which exceed the ability of the affected society to cope using its own resources’.

Pre, During and Post Disaster Phase

Key Phases of Disaster Management

There are three key phases of activity within disaster management:

1. Pre – Disaster

Before a disaster to reduce the potential for human, material or environmental losses caused by hazards and to ensure that these losses are minimized when the disaster actually strikes.

2. During Disaster

It is to ensure that the needs and provisions of victims are met to alleviate and minimize suffering.

3. Post Disaster

After a disaster to achieve rapid and durable recovery which does not reproduce the original vulnerable conditions

Common Hazards/Disasters in Bangladesh

1. Flood, Flash Flood
2. Cyclone
3. Storm surge, Tidal surge
4. Tornado
5. Drought and desertification
6. River erosion
7. Earthquake
8. Arsenic Contamination
9. Pollution
10. Salinity
11. Water logging
12. Biological – Bird flue, Viral Polio, Diarrhoea, Anthrax, Bacterial, water and airborne
13. Animal attacks
14. Pest attacks
15. Cold wave
16. Heat wave
17. Fog
18. Thunder storms
19. Lightening
20. Road, river and rail accident
21. Landslide
22. Land subsidence
23. Dust storm
24. Tsunami
25. Social conflict (riot, terrorism, hijack, bombs)
26. Cyber attack
27. Financial crisis
28. Famine
29. Stampede
30. Fire
31. Collapse

Risk Profile

DROUGHT

FLASH FLOOD –Unpredictable, recurring, uncertain.

FLOOD - Inundates more areas, increases river erosion, breaches embankments, damage infrastructures.

SALINITY INTRUSION

CYCLONE - Remain to be the deadliest and most destructive hazard. It is recurring, with lingering aftermath, complex recovery.

AND CLIMATE CHANGE HAZARDS, EARTHQUAKES, FIRE BREAKOUT, INFRASTRUCTURE COLLAPSE ETC.

Disaster Management Institutional Framework

Disaster Management (DM) Regulatory Framework
