

HUM 2101: Sociology and Disaster Management

Develop the concept of population and migration, youth issues and how technological factors affect in life. Impact of disaster management in real life

Lecture 8

Md. Arif Chowdhury

Lecturer

Dept. of Climate and Disaster Management
Jashore University of Science and Technology

Population

- Population, in human biology, the whole number of inhabitants occupying an area (such as a country or the world) and continually being modified by increases (births and immigrations) and losses (deaths and emigrations).

Factors which affect population change

War

- ✓ War can increase the death rate due to conflict
- ✓ It can prevent investment in health and education.

Food surplus

- ✓ Countries with famines or lack of food supplies will have high birth and death rate leading to population decline.

Factors which affect population change

Health

- Access to health care can increase birth rates and lower death rates meaning a population will increase

Women role

- If women are better educated and work they will have less children lowering the birth rate

MIGRATION

Where people move from one place to another. This will affect population change because if more people move into a place the population will increase there but decrease where they have come from

Youth Crime

- ✓ Youth Crime is described as participation in illegal behaviors by minors.
- ✓ Criminal behavior by a young person.

Types of Youth Crime

1. Theft

Theft crimes are described as taking property belonging to another and permanently depriving them of it. This can include shoplifting, fraud, car theft, and robbery.

2. Assault

Assault crimes are described as inflicting harm on another person. This can include common assault, unlawful wounding, and sexual assault.

3. Drug Abuse

Drug abuse crimes are described as the habitual taking of illegal drugs. This act usually involves crimes such as theft of drugs, drug trafficking, drug sales, and drug manufacturing.

4. Criminal Damage

- Criminal damage is described as unlawfully damaging property that belongs to another. Examples of this include graffiti, arson, and forced entry.

5. Possession of Weapons

- Illegally carrying weapons such as knives or guns can result in arrest and prosecution. This is because you may be intending on using the weapon in public areas which poses a threat to others.

Factors Contribute to Youth Crime

1. Education

Those who are failing to meet grades or improve on their education may tend to give up on trying to improve their work and turn to acts of crime instead.

2. Peer Pressure

Students surrounded by those who actively commit crimes may feel the need to ‘fit in with the crowd’. To keep their friends, youths may be peer pressured into committing a crime.

3. Abuse

Youth crime does not always emerge from being at school. It is believed that the environment youths grow up in can have an impact on their likeliness to commit crimes.

4. Financial Issues

Growing up in poverty means you may be given fewer opportunities in life in terms of education, job opportunities, and travel.

5. Media

Those who actively engage with violent media on games or film could be more likely to show signs of aggressive and violent behavior.

6. Family problem

7. Loving affair

Causes and remedies of Youth Unrest

Role of Technology in Disaster Management

The role of technology in the disaster management cycle is often under-appreciated. It can be used at every stage of the cycle, from preparedness to response to recovery.

- ✓ **Preparedness:** Technology can be used to help create and implement emergency plans. It can also be used to monitor potential threats, such as weather patterns that could lead to a natural disaster.
- ✓ **Response:** In an emergency, technology can be used to coordinate and manage the response effort. It can also be used to provide information and assistance to those affected by the disaster.
- ✓ **Recovery:** Technology can help with the rebuilding process after a disaster. It can be used to assess damage, create reconstruction plans, and coordinate relief efforts.
- ✓ **Mitigation:** The cycle's end points out the value of a well-rounded approach. Mitigation, like preparedness, entails doing something to lessen the chances of a disaster happening again. These measures are important at any time, but especially in the wake of a disaster when a community or organization may still be fragile.

Future of Disaster Management and Technology

- ✓ Technology can help us identify threats before they happen so that we can take measures to prevent them from becoming a reality.
- ✓ Technology also helps us communicate with each other easily during a crisis situation so that we can work together towards finding solutions for issues related to natural calamities such as earthquakes, hurricanes and floods etc.

Some examples include:

- ❖ Using drone technology to assess damage after an earthquake has occurred
- ❖ Using GPS tracking systems on emergency vehicles to ensure that they do not become disoriented while responding to calls.
- ❖ The use of social media platforms like Twitter or Facebook where citizens can post pictures from their phones about what happened (e.g., where they're located), how bad it is outside right now ("shelter-in-place" orders), etc.
- ❖ Making sure everyone knows where shelters are located so people don't have to wander around aimlessly.

Types Of Technologies In Disaster Risk Reduction

The application of technologies are more vital and need to be more creative in the disaster “P” phase of prevention (mitigation) and preparedness than in the disaster “R” phases – response and recovery.

- **Database Management System (DBMS):** A computer based system that is used to store, manipulate and retrieve data. In any DBMS, there are three types of data models used to store and retrieve (recover) data namely hierarchical, network and relational models.
- **Management Information System:** MIS would have to cater to the following types of information:
 - **Planning Information** - Certain standard norms and specifications are used in planning of any activity.
 - **Control Information** - Reporting the status of an activity through a feedback mechanism.
 - **Knowledge Information** - A collection of information through the library records and the research studies to build up a knowledge.
 - **Organization Information** - When the information is used by everybody in the organization.
 - **Functional/ Operational Information** - When the information is used in the operation of a business.
 - **Database Information** - When the information has multiple use and application.

Decision Support System:

- Decision Support System can be defined as an integration of computer hardware, software and methodology that is designed to complement the cognitive thinking of human beings in their decision making.
- It should be understood that DSS supports in the process of decision making and does not always give a decision itself.

Geographical Information System

- Geographic Information System is a computer based system comprising hardware, software, data, people and methodology that combine to provide answers to queries of a geographical nature as and when required.
- GIS may be considering as the evolution of maps and Global Positioning System is a satellite based system that gives accurate location information anywhere on earth.
- It can be useful for risk assessment in a particular area.
- GPS can be useful for emergency response to locate dangerous points and to find shortest route for the responders using network analysis.

Remote Sensing

- Remote sensing is the science of acquiring information about the Earth's surface without actually being in contact with it.
- This is done by sensing and recording reflected or emitted energy and processing, analyzing, and applying that information
