

Chapter-05

Person-Job Fit

Definition:

Person-job fit means how well a person's **skills, personality, and interests** match a specific job.

Why It Matters:

- People are **happier and perform better** when their job aligns with their personality.
- If a person is in the wrong job, they may feel **frustrated** and leave.
- **Example:**
 - A creative person may enjoy working as a **graphic designer** but struggle in a **data entry job**.

Cultural Differences:

- In **individualistic countries** (like the USA), companies often adjust jobs to fit people's strengths.
 - In **collectivistic countries** (like Japan), employees are expected to adjust themselves to fit the job.
-

Person-Organization Fit

Definition:

Person-organization fit means how well a person's **values, beliefs, and goals** align with a company's culture.

Why It Matters:

- Employees who feel aligned with their company's **values** are more **satisfied and loyal**.
- If there's a mismatch, employees are more likely to **quit**.
- **Example:**
 - Someone who values **sustainability** may not be happy working for a company that harms the environment.

How Job Seekers Evaluate Companies:

- Many people **research companies online** before applying.
 - They check **company websites, social media, and employee reviews**.
-

Uber's Leadership and Values

Case Study: Uber's Corporate Social Responsibility (CSR)

- Uber struggled with **poor leadership and a toxic work culture** in its early years.
- After scandals, Uber **changed its leadership** and focused more on **ethical business practices**.
- A company's **values affect hiring, employee retention, and public image**.

Lesson: Strong leadership and good company values help a company succeed in the long run. If a company has a bad culture, it may face problems like scandals and high employee turnover

Personality

Definition:

Personality is a person's unique way of thinking, feeling, and behaving.

Key Points:

- Personality is **consistent over time**.
 - It helps explain why people behave differently in the same situations.
 - **Example:**
 - Some people naturally **enjoy socializing**, while others **prefer quiet activities**.
-

Measuring Personality

Measuring personality is the process of analysing a person's thoughts, feelings, and behaviors to understand their traits. This is done using tests, questionnaires, or observations to identify characteristics like friendliness, responsibility, or emotional stability.

How Companies Measure Personality:

1. **Self-report surveys** – People answer questions about their own traits.
2. **Observer ratings** – Others (like coworkers) analyse someone's personality.

Problems with Personality Tests:

- Some people **fake answers** to appear more suitable for a job.
 - However, well-designed tests reduce this risk.
-

Personality Models

The **Myers-Briggs Type Indicator (MBTI)** is a personality test that groups people into **16 personality types** based on four key traits:

1. **Extroversion (E) vs. Introversion (I)**
 - **Extroverts (E)** get energy from being around people.
 - **Introverts (I)** feel more energized when they spend time alone.
2. **Sensing (S) vs. Intuition (N)**
 - **Sensing (S)** people focus on facts, details, and what they can see or touch.
 - **Intuition (N)** people focus on big ideas, patterns, and possibilities.
3. **Thinking (T) vs. Feeling (F)**
 - **Thinking (T)** people make decisions using logic and facts.
 - **Feeling (F)** people make decisions based on emotions and personal values.
4. **Judging (J) vs. Perceiving (P)**
 - **Judging (J)** people like plans, organization, and structure.
 - **Perceiving (P)** people prefer flexibility, spontaneity, and going with the flow.

Each person is assigned a combination of four letters (e.g., **INTJ, ESFP**) based on their traits.

Weakness of MBTI

The **problem** with MBTI is that it **does not have strong scientific support**. This means researchers have found that it may not accurately predict personality or behavior, and people may get different results if they take the test again.

Big Five Personality Traits

The **Big Five Personality Traits** is a popular and scientifically supported model used to describe different personality types. It includes five key traits that help explain how people think, feel, and behave.

1. Conscientiousness – Being responsible and organized

- People high in this trait are **hardworking, careful, and reliable**.
- They like to **plan ahead, follow rules, and complete tasks on time**.

- Example: A student who always does their homework on time and keeps their room clean.

2. Emotional Stability (Opposite of Neuroticism) – Staying calm under pressure

- People with high emotional stability are **relaxed, confident, and don't get upset easily**.
- They handle stress well and stay positive in difficult situations.
- Example: Someone who stays calm during an exam instead of panicking.

3. Extroversion – Being social and energetic

- Extroverts love **talking to people, making new friends, and being in busy places**.
- They are often **outgoing, enthusiastic, and full of energy**.
- Example: A person who enjoys parties, teamwork, and public speaking.

4. Openness to Experience – Being creative and open-minded

- People high in this trait are **curious, imaginative, and enjoy learning new things**.
- They like to **explore new ideas, travel, and try new hobbies**.
- Example: Someone who enjoys reading about space, trying new foods, or learning a new language.

5. Agreeableness – Being kind and cooperative

- People with high agreeableness are **friendly, caring, and helpful**.
- They get along well with others and avoid conflicts.
- Example: A person who helps a friend in need or comforts someone who is sad.

Why is the Big Five Model Important?

- It helps understand **why people behave differently**.
- It is used in **hiring, psychology, and personal growth**.
- Unlike other personality tests, it has **strong scientific support**.

This model helps explain **how different personality traits affect relationships, work, and daily life!**

Exhibit 5-3

Model of How Big Five Traits Influence OB Criteria

The Dark Triad

The **Dark Triad** is a set of three personality traits that are considered **negative** because they involve selfish, dishonest, or harmful behavior. People with these traits tend to focus on their own success, even if it hurts others.

The Three Traits of the Dark Triad

1. Machiavellianism – Being manipulative and using others

- People with this trait are **cunning, deceitful, and will do anything to get ahead**.
- They often **lie, cheat, and use others for their own benefit**.
- They believe that **the end justifies the means**, meaning they don't care if their actions are right or wrong as long as they succeed.
- **Example:** A politician who makes false promises just to get votes but doesn't care about helping people.

2. Narcissism – Being self-centered and craving attention

- Narcissists think they are **better than others and deserve special treatment**.
- They always want **praise, admiration, and to be the center of attention**.

- They often **ignore other people's feelings and take credit for things they didn't do.**
- **Example:** A boss who takes credit for their team's hard work but blames employees when something goes wrong.

3. Psychopathy – Lacking empathy and guilt

- People with this trait **don't feel bad when they hurt others.**
- They can be **cold, aggressive, and enjoy taking risks.**
- They **don't care about rules or social norms** and may act impulsively without thinking of consequences.
- **Example:** A scammer who tricks elderly people into giving them money without feeling any guilt.

Why Is the Dark Triad Important?

- These traits are often **linked to unethical behavior** in business, relationships, and leadership.
 - People with Dark Triad traits may be **charming at first** but can be **dangerous, dishonest, or emotionally harmful** in the long run.
 - Psychologists study the Dark Triad to **understand toxic behaviors and prevent harm** in workplaces and relationships.
-

Honest and conscientious people tend to behave ethically.

- People who are naturally honest and responsible (conscientious) are more likely to follow ethical guidelines and act with integrity.

Machiavellians and narcissists may bend the rules for personal gain.

- **Machiavellianism:** A personality trait where people manipulate others to achieve their goals.
- **Narcissism:** A personality trait where people have an inflated sense of self-importance and lack empathy.
- These individuals may break or manipulate ethical rules to benefit themselves.

Self-awareness and ethical training can help employees make better choices.

- If employees understand their personality traits and receive ethical training, they can improve their decision-making and avoid unethical behavior.
-

Abilities in the Workplace

Definition:

Ability is a person's **natural or learned skill** to perform tasks.

Types of Abilities:

1. **Intellectual Ability** – Thinking, reasoning, problem-solving.
 - Example: Engineers need strong problem-solving skills.
 2. **Physical Ability** – Strength, endurance, coordination.
 - Example: Construction workers need physical strength.
-

Values in the Workplace

Definition:

Values are **deeply held beliefs** about what is important in life.

Types of Values:

1. **Terminal Values** – Long-term life goals (e.g., success, happiness, freedom).
2. **Instrumental Values** – Ways to achieve those goals (e.g., honesty, hard work, kindness).

Example:

- If a person values **family** (terminal value), they may prioritize **work-life balance** (instrumental value).
-

Generational Values

Do Generations Have Different Work Values?

- Some research suggests **younger and older workers have different values**.
 - However, studies show that people at the same age have **similar attitudes**, regardless of generation.
-

Key Takeaways

1. **Personality and job fit affect work satisfaction and performance.**
2. **The Big Five model is a strong predictor of behavior at work.**
3. **The Dark Triad traits can lead to unethical behavior.**

4. Abilities and values play a big role in career success.

Are Millennials More Narcissistic?

- Millennials are known for being **tech-savvy, open-minded, and engaged**.
 - However, some studies suggest they may also be **more self-focused** than older generations.
 - But when comparing past generations at the same age, **the differences are not significant**.
-
