Code Smells

- Code smell refers to symptoms in code that indicate deeper problems in its design or structure. While code smells don't necessarily break functionality, they suggest areas that could lead to maintenance difficulties, bugs, or poor performance down the line.
- **Some common types of code smells:**
 - Inappropriate Naming
 - Comments
 - Dead code
 - Primitive obsession
 - Large class
 - God class
 - Lazy class
 - Black sheep

- Long method
- Long parameter list
- Feature envy
- Contrived complexity
- Magic Numbers and Hardcoded Values
- Duplicate codes
- Switch statements

Refactoring

- "Refactoring is the process of changing a software system in such a way that it does not alter the external behavior of the code yet improves its internal structure." – Martin Fowler
- Appropriate use of OOP is the biggest strength here...
